CIBC RSI

RSI Overview Deliverables

● Market Risk General MR, IRC, Equity & Debt Specific Risk, Stressed VaR, Stress Testing ● Trading Credit Risk CVA, Limits Monitoring, Stress Testing, Master Agreement Details, Pre-Deal Check, Ratings Maintenance ● Trading Operational Risk Product Authorization, Limit Breaches, KRIs, Reporting ● Analytics VaR Methodology, Stress Testing, Model Calibration, Exposure Modeling ● Economic & regulatory capital IRC enhancement ● Data/ reporting Data quality, Master data management, Derived historical data, Unstructured data management, Standard/ad hoc reporting/analysis, Meta data

Risk Model & Sensitivities

• DGVRT assumed MR factors log-normally distributed; statistical parameters based on 250 days of history; inputs (risk factor sensitivities, correlations, volatilities, average returns, market prices of risk factors) @HistSimm based on historical distribution of rolling 500 daily changes in risk factors
● Debt Specific Risk DSR default + idiosyncratic spread risk - MC model with 4 components: 1 Marginal distribution calibration to estimate/ calibrate spread Use spread simulation model; small spread moves ⇒ spread volatility risk, larger moves ⇒ migrations and defaults; models total credit spread of individual bond as general spread + specific component; general spread from bond index given by observable index or inferred as average credit spread of basket of bonds comprising a Credit Group; specific spread component = difference between total credit spread inferred from bond's observable price and sectorial spread; use 90 Credit Groups of bond indices, baskets of traded bonds, spanning markets, economic sectors, credit qualities maturities; use MC simulation to compute specific risk; join marginal distributions using copulae to model tail dependence embedded within credit spread data; model sector and specific spread distributions using Student's t-distributions; calibrate historical bond index data to obtain distribution parameters via moment matching Risk sensitivities (45) equity/ metal/ oil/ FX DGVRT, duration e.g. base metal vega risk, CS idiosyncratic risk

Interest Rate Risk

●IR Outright and Curve risk portfolio sensitivity to changes in yield curve (Frontier/Voyager zero rate yield curves for sensitivity, VaR generation) ●IR Swap Spread risk portfolio sensitivity to changes in spread between govt yields and swap yields ●IR Vega risk sensitivity to changes in IR volatilities ●Total IR risk all IR risks + IR Theta with correlations between IR components (zeroes, swap spreads, volatilities)

Credit Spread Risk

Due to change in spreads (bond index, government yields) **• Generic CS risk** change in spread (Treasuries, mapped bond index) **• Idiosyncratic CS risk** change in spread (specific issuer, mapped index) **• Total CS risk** = Generic CS risk + Idiosyncratic CS risk assuming zero correlation

Analytics

Analytics OLSM

(Optimized Least-Squares Monte Carlo) simulation to compute potential future exposure (PFE) profile of derivatives with complex optionality for which no analytic approximation exists; relies on Least-Squares approximation by Longstaff & Schwartz; traditionally nested Monte Carlo MC or approx surrogate structured deal computationally expensive & approximate work streams IR & FX basis risk, Equity Dividend, Volatility Skew, Monte Carlo on Monte Carlo correlation risk equity-equity, commodity-commodity, commodity-FX assets classes dividend risk measured through sensitivity based variance-covariance; calculated for 1 bp change in dividend yield, applied to shocks based on dividend yield volatilities; dividend yield volatilities for indices based on time series of forward dividend yields and dividend yield volatilities for single stocks

Analytics Model gaps

Market Risk

Market Risk Data

 Data groups IR market data Yield/zero curves for bonds, swaps (zero curves) bootstrapped from corresponding yield curves), spread curves, volatility cubes or surfaces, basis spread curves Trading credit CDS spreads, CDS indices FX related FX spot rates, FX volatility surface EQ related equity indices, common stock prices; equity volatility surfaces Commodity related commodity spot prices, commodity forward/future price curves, commodity price volatility surfaces 2 Data structures Scalar asset spot prices FX spot prices, equity spot prices, commodity spot prices bond prices 1-dim term structure curves (1-dim vector data) IR yield/zero curves, IR spread curves, CDS spread curves, commodity forward/futures curves, ATM FX implied volatilities, commodity price volatilities, ATM equity implied volatilities 2-dim surfaces ATM IR implied volatility surfaces, equity implied volatility skews, FX implied volatility skews 3-dim cubes IR implied volatility skew cubes Matrix market data correlation metrics, transition probability metrics

Trade data Instrument (security term & conditions, Security, Debt, Option, Future, Forward) Instrument Type (product type) Trade (daily trade position information) Structured Product, Cash Flow, Schedule (average rate schedule, payment Schedule, reset schedule, amortizing schedule, schedule) Instrument state (daily basis 'NEW', 'SG_DONE', 'SG_RESULTS_LOADED') @CIBC MHS (market data store) central repository for Voyager (market risk minus specific risk), Euclid (specific risk), TRACS (credit risk) Types 1-market data 2-variance/ covariance (derived market data) 3-statistical parameters (derived market data) **@ Feeds** generates 76 market data feeds (34 feeds in MR) 30+ FO systems (1 feed 1 system)

Incremental Risk Charge (IRC)

⊙What? Loss due to default/changes in quality at 99.9% CI over 1 year **⊙Phase 1** MC simulation of <u>Merton structural model</u> for default/credit migration Phase 2 MC simulation of credit/equity states based on Stochastic Volatility model (stochastic price + variance process driven by Brownian motions with constant linear correlation)

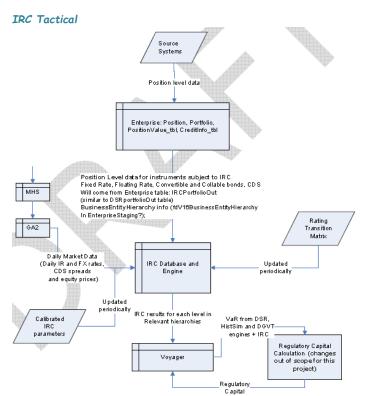

Phase 1 design <u>OParameterize correlation with concentration parameter</u> to couple issuer/ market concentrations to migrations and defaults @Constant level of risk (same loss distribution over liquidity horizon 3 months liquid within 1 year horizon) 3 Aggregation/liquidity horizon correlation - use hedge for sub-portfolios with multiple liquidity horizons @Valuation principles (full valuation; same valuation by front and risk); for equities no model needed (prices simulated directly) @Credit Spread & Mark-To-Market Adjustment - 2 credit spread types: @CDS spread: bond spread, can differ in magnitude for technical reason; @Bond spreads: yield spread, asset swap spread, option adjusted spread (OAS or Z-spread), approach) @Risk model (requirement, development, unit test) @Market data (requirement, document, unit test) @Trade position data (requirement, development, unit test, SIT, UAT, Regression)
Gap analysis
Products (structured credit run-off portfolio)
Position data (instrument type, business entity for aggregation -- insufficient id of securitized position, parallel effort to standardize DSR treatment, banking book/ securitization treatment) Market data (credit spreads per currency/sector/rating - insufficient sector coverage, better granularity)

Regulatory changes

Metrics to calculate regulatory capital for market risks

	General Market Risk	Specific Market Risk
'Ordinary" Trading Book Positions	VaR _G + S-VaR _G	VaR _S + S-VaR _S (equity issuer and prepay risk)
"Linear" Traded Credit Products (CDS, Indices)	VaR _G + S-VaR _G	VaR _s + S-VaR _s + IRC
Securitisation Positions and N th -to-default Credit Derivatives	VaR _G + S-VaR _G	Market Risk Standard Approach
Correlation Trading Portfolio	VaR _G + S-VaR _G	CRM

●Engine calculate *default risk* + *credit migration risk* that are incremental to risks captured in current VaR **②Trade Position Feeds** leverage existing data feeds augmented with extra data elements **③Market Data** new feed for CDS spread data **④Reporting** Regulatory Capital calculation incorporated with new charge **⑤Hardware** engine to run independently but integrated to existing environment **⑤Operation** improve existing operational procedure to monitor and report

Requirements IRC

Track Credit Migration + Defaults of underlying & counterparties ●Multiple liquidity horizons (3 months - 1 year, time to sell/hedge in stressed market) ●Cover position subject to capital charges for specific IR risk ●Include/exclude all listed equity, derivative positions, securitization positions ●Impact of correlations/ clustering between default and migration events (higher capital charge for concentrated portfolio, concentration under stressed conditions) ●Exposures on non-netted basis (excepted long/ short positions on same instrument) ●Basis risks (by product, capital structure, rating, maturity, vintage, payout trigger) ●Impact of potential risks between maturity & liquidity horizon, default risk, impact of optionality from price changes ●Constant level of risk modeling ●Correlation & diversification between multiple obligors and obligor/ market risk factors ●Risk mitigation & netting effects as required ◆credit migration risk ◆credit spread risk + equity price risk ◆IRC at a 99.9% CI, over a 1 year time horizon ◆age a portfolio of trades for up to a 1 year period ◆Re-investment logic at end of liquidity horizons to positions that will mature/roll-off during portfolio aging function

Stressed VaR

■ What? Measure VaR due abnormal market behavior during selected time period ● Approach ②Use existing models with current risk factor levels & current portfolio ②Substitute [current risk factor volatilities & correlation structure] → those from historical period with greatest VaR for portfolio 3 For historical approach supplement actual historical returns with antithetic returns @For simulation approach replace marginal & joint risk factor distributions in production → those inferred from historically stressed period ②General Market Risk (GMR) @Based on historical state changes from stressed period, sensitivitybased portfolio valuation & current aggregation structures @Augmented by antithetic sampling & risk shocks at individual risk factors **Data**: use data with current systems; require time series of risk factors (interest rates, spreads, prices, implied volatilities, etc.) in order to generate historical shocks @ Equity Specific Risk (ESR) @Based on decomposition of historical state changes from stressed period into general and specific components BUT use static set of regression indices (instead of dynamically assigning indices) to make general market risk comparable from one day to next @Use only 2 indices (1 country index + 1 country/ regional sector index)
● Debt Specific Risk (DSR)

© Use historically sampled spreads to compute spread volatility & default risk @Use historical changes in spreads + credit spread sensitivities to construct P&L distributions during stressed periods Data (current) historical market spreads (total spread of basket of bonds) based on time series of bond index spreads + information on total spread for each Credit Group; BUT no historical information on total spread at issuer level (historical data on total spread for basket of bonds, but not for individual bonds)

Requirements Stressed VaR

◆Simulate dynamic portfolio rebalancing ⑤Replace designated trades that roll off during stress simulation with new trades per requirements (e.g. delta-hedged portfolios) ⑥Shock curves via parallel or non-parallel shifts of curves and volatilities ⑦Create stress scenario from historical market data moves by choosing start/end time

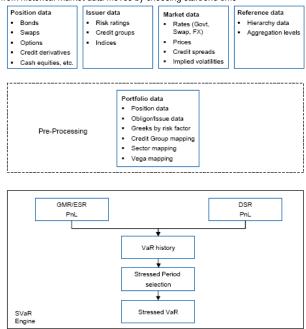

Figure 10. Stressed VaR framework overview

Stressed VaR Tactical

● Engine No new engine; DGVRT Parametric Model used as Phase I with calibration applied to stress period's volatilities ● Trade Position Feeds No new position data is required ● Market Data No new market data required but need to increase the length of the series in database to support "stressed" period selection ● Reporting new report ● Hardware no new hardware ● Operation improve existing operational

VaR, IRC, Stress test Performance

Back testing

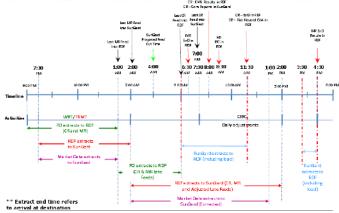

What? Compare theoretical VaR against actual P&L **@Basel framework** periodically compares portfolio or asset's daily VaR against daily P&L; model to generate the times of VaR exceeding P&L equal to (1-alpha) * time periods for back testing ❷Basel 3 zones **©Green Zone** - 0 to 4 adverse exceptions out of 250 - no add-on factor **@Yellow Zone** - 5 to 9 adverse exceptions out of 250 - add-on factor of from 0.40 to 0.85 @Red Zone - 10 or more adverse exceptions out of 250 - add-on factor of 1.00 Standards @Bank level aggregate risk and risk by asset class measured by models used in capital adequacy calculations @Daily back testing results at business & desk levels reported to CMRM management & line management; alert to new or unaccounted-for risks; routine quality controls for risk models and systems @Report adverse SPL exceptions at bank-level to OSFI within 1 business day @Monthly analysis of SPL results submitted to OSFI for review Sacktesting exceptions and average divergence (average difference between absolute value of SPL & VaR for all adverse exceptions) at bank-level → reported to OSFI quarterly through Basel Capital Adequacy Return schedule 42 @Backtesting comparison corresponds to structure of VaR limit hierarchy **VaR comparisons** against next day's changes in static portfolio P&L (SPL results reviewed periodically against actual P&L) ®Exceptions at CIBC and business levels (Tier 1 + Tier 2) validated, explained, documented, reported to senior management @Backtesting results + exceptions available to internal/ external auditors @General Methodology SPL = P&L due change in market parameters, with positions being held constant - Valuation methodology

Value portfolio using Day 1 market parameter @Revalue same portfolio using Day 2 market parameters ③SPL = change in portfolio value - SPL generation process ①Obtain greeks for Day 1 ②Obtain Day 1 + Day 2 market parameters ③Calculate change in market parameters between Day 1 + Day 2 @Compute SPL for Day 2 using change in market parameters and greeks © For each individual desk, calculate SPL at greeks level by each appropriate risk factor Market Risk Methodology calculate MR SPL by taking Day 1 trading positions, as represented by the greeks, and actual market movements between Day 1 and Day 2. Basic formula based on Taylor series: SPL = Σ over all instruments $[\delta^* \Delta S + (1/2) \Gamma^* (\Delta S)2]+$ $v^*\Delta\sigma + \Theta$ where <u>SPL</u> = 1-day change in portfolio value with positions held constant; $\Delta S = \text{day}$

over day change in price of underlying; $\delta(delta)/\Gamma(gamma)$ 1st/ 2nd -order marginal sensitivities; \underline{v} (vega) = 1st order marginal sensitivity of instrument price to volatility (σ) of price of underlying, Θ (theta) = 1-day change in portfolio, or measure of time decay, assuming no change in market prices @Equity Specific Risk back-tested against portion of SPL related to equity specific moves (market and specific SPL split for given move in price of particular equity, table containing betas for such equity to relevant industry sectors and/or indices generated on a regular basis for DGVRT VaR)

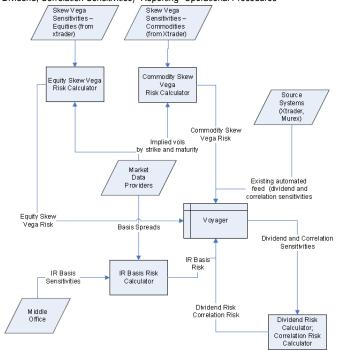

Debt Specific Risk indirect approach. Formula: DSR_PL(t+1,t) = Total PL(t+1,t) - GGM_PL(t+1,t) for each position where Total PL(t+1,t) = total P&L changed = change in mark-to-market price between day t+1 and day t, GGM_PL(t+1,t) = gross general market (GGM) P&L, which includes P&L impact of changes in all underlying market factors. Hence DSR P&L = DSR_PL(t+1,t) consists of P&L components not explained by GGM P&L SNet Trading Related Revenue (NTRR) excludes "Other" trading revenue (Total trading revenue = NTRR + Other trading revenue), NTRR = trade date based-MTM revenue from trading businesses driven by market movements; components of total trading revenue not included in NTRR: Sales and commission income, Changes to reserves, Changes to valuation adjustments, New business revenue including inception revenue and fees

EOD Feed schedule

Enhanced VaR Tactical

•VaR Calculation tools for new sensitivities (IR Basis, Equity+ Commodity Skew Vega, Dividend, Correlation Sensitivities) •Reporting •Operational Procedures

IMA (Internal Model Approach) Documents to be submitted

● Market risk policies (describe framework) ● Organization structure (independence/ segregation of duties) ● Measurement systems (describe methodologies & models) ● Stress testing program (selection methodology for scenarios) ● Back-testing program (previous year's results, exceptions) ● Technological environment (diagrams, processes) ● Limits structure (hierarchical structure, approvals) ● Management information systems (regular & ad-hoc reports) ● Databases of relevant information (time series of risk factors, P&L) ● Reports of independent assessments (internal/ external audit) ● Estimation regulatory capital (SMM + IMA) ● Description exposures (by product & risk factor)

OSFI Initiatives

Business Case

● Develop & implement new **business/ risk framework** including capital models required to meet new IRC and MRA guidelines by OSFI for December 2010 ● Develop **Capital Contingency plan** required by OSFI including **capital impact assessment** with consideration to use of multipliers or standardized approach in the worst case scenario that OSFI does not approve CIBC's IRC and MRA enhancements.

Project Steering Committee Liam Mason, Matt Willis, Melody Glover, Greg Frank

Advisory Pankaj Agarwal (Finance-Reporting Division) Robert Kowara (Internal Audit) Spiro Daoussis (Risk Management - Credit Risk Analytics) Laurie Russell (Risk Management — RSI Project)

Overall Project Director (PMO) Lily Leung

Work stream Business Lead ◆IRC Tim Xiao ◆MRA/Stressed VaR Rina Shklyarman ◆MRA/Enhanced VaR Measures Matt Willis ◆Securitized Products, Illiquid portfolio Tim Mills ◆Contingency Plan Michael S Lau ◆OSFI Governance Melody Glover Plan

Work streams

Work stream	Mandates
IRC	Develops/ implements new IRC model & other related initiatives BCBS guidance for "Guidelines for computing capital for incremental risk in trading book", (IRC) Jul 09
MRA	Develops/ implements Stressed VaR, Enhanced VaR, exponential weighting, volatility scaling factor - BCBS guidance "Revisions to Basel II market risk framework", (MRA) Jul 09
Securitized	Develops new business/operational framework within Capital
Products, Illiquid	Markets, Securitization Work Stream, Chief Accountants to
Portfolio	support new capital treatment for securitized product & treatment for illiquid positions (BCBS-MRA guidelines Section VIII)
Contingency	Develops impact analysis from above initiatives to Senior
Planning	Management of the Bank and OSFI. Contingency plan should consider standardized and multiplier approach in worst case scenario of non approval for IRC and MRA applications and capital plan work with Capital Management Team that links the contingency plan to the overall capital plan of Bank
OSFI Governance	Develops/ implements new OSFI compliant framework across project and work streams e.g MIOC approach; completed and resolved self assessment gap analysis. Works with PMO through preparation of all key deliverables into OSFI

Credit Risk

Requirements

◆Methodology framework & Regulatory calculation based on ●Basel II AIRB factor based/credit exposure measurement (for parallel run) ●Monte Carlo Simulation using Internal Models for regulatory approval ◆Counterparty Credit Risk Exposure + CVA measurement for OTC derivatives & Repo-style transactions ◆Contingent & Credit

exposure measurement for Repo-Style transactions *Direct Credit Exposure measurement *Credit derivative reference assets *Negotiable paper *Certificate of deposits *Fixed deposits *FX Settlement Risk Exposure measurement (FX and XCCY Swaps) *Credit Stress Testing & Sensitivity Analysis *Credit Exposure Limits Management & Limit Excess Workflow Management & Limit Excess Reporting *Pre-deal /trade credit limit check & what-if analysis *Counterparty Maintenance *Netting & Collateral Agreements *Document Management & Tracking *Regulatory, Management / Credit Economic Capital Measurement & comprehensive Reporting *Wrong Way Exposure & risk measurement *Portfolio Analysis in production *Security Administration & Audit functionality *Ageing/Stale calculations for Wholesale Banking products & all market and reference data for *OTC derivatives & Repo-style transactions for contingent credit exposure measurement *Fixed Deposits *Negotiable Paper e.g. Credit Derivative reference assets *Loans *Collateral pledged/received * pledges to exchanges

Credit Risk Use Case

*Simplified credit, market and liquidity risks High level (p. 3) *Market data analysis (Market Data Manager) (p. 7) *Determine/ calibrate simulation parameters (p. 9) *Market data/ risk factor simulation (p. 13) *Bootstrap & calibrate market data (p. 15) *Transaction valuation and aging (batch or real-time) – credit risk (p. 17) *Transactions/positions data transformation (p. 19) *CCISization (p. 21) *Adjustment overrides/ deal structures (p. 23) *Netting treatment (p. 25) *Collateral treatment (incl. closeout) (p. 27) *Client (party) reference information (p. 29) *Adjudication and documentation (p. 31) *Reference data CIBC hierarchies (p. 33) *Calculate accounting measures (p. 35) *Aggregation and derived risk measures (p. 37) *Reporting and OLAP (p. 39) *Limit excess workflow (p. 41) *Report limit breaches (p. 43) *Pledging/ projection forecasts (collateral) (p. 45) *Sensitivity analysis and stress testing (p. 47) *Month-end (p. 49) *What-If/ Pre-deal check real-time (p. 51) *Credit Value Adjustment CVA (p. 53) *Power analyst & parameter testing (p. 57) *Economic and regulatory capital calculation (p. 59)

Credit Risk Exposure

SUNGARD ADAPTIV

- Register price factors required by valuation models (FX rate, Interest rate, FX volatility surface)
 Price factor models register risk factors used to
- evolve price factors. Construct correlation matrix of risk factors and calculate decomposition (Cholesky or Eigenvalue)

 Correlations
- Generate grid of of dates based on the Base time grid that has been defined in the calculation definition. With Dynamic Dates on, all other significant dates that are required as per deal properties are also included
- ●Generate grid of dates based on Scenario Time grid (defined in calculation definition)

 REPEAT ⑤ through ⑤
- For each scenario, for each given point on the scenario grid dates and for each registered factor, generate uniformly distributed random numbers through the Box-Muller transformation (using methods available from .net library random class)

 Random Numbers

Values – Scenario Grid dates

Factor Paths - Scenario Grid dates

- ❸Path values for scenarios' risk factor types ready? pricing function triggered at base grid dates and dynamic dates (PV's). Calculation of price factor values at base grid dates (& dynamic dates) happen as per factor model. Path values will form an input in this calculation. If the time points of base grid date do not coincide with the time points of the scenario grid, interpolated path values are taken
- ⇒ Price Factors Base Grid dates and dynamic dates
- PV's Base Grid dates and dynamic dates

Credit Risk Terminology

*BLACK-SCHOLES *Collateral *Credit VaR (CVaR) *Credit Risk Adjudication *Credit Valuation Adjustment (CVA) *Duration *DV01 *Economic capital *Interest Rate Risk *Monte Carlo *Potential Future Exposure PFE
Credit Valuation Adjustment (CVA)

Factors influencing CVA

- Definition CVA = Expected (average) credit loss from c/p transactions = Expected exposure (mean of distribution of evolution of mark to markets) × Counterparty default probability × "loss given default"
- ◆ Accounting adjustment ⇒ fair value, marked to market, accounting for potential counterparty default ◆ Credit pricing ⇒ credit risk fairly priced/ compensated ⇒ measured with Risk Adjusted Return on Capital (RAROC): originators meet RAROC hurdle then remain "owners" of credit risk
- ⇒ Evolution of credit pricing: internal transfer pricing to transfer credit risk into a central function and the originating desks pay "insurance" to divest themselves of this risk ⇒ complex measurement methodologies, infrastructure, politics ⇒ CVA function with own P&L, collects premiums from originating desks in return for indemnification ⇒ front office focus on risks affecting P&L ◆Hedging P&L volatility ⇒ active CVA management into trading positions ⇒ CVA charge for volatile market spreads (Citigroup's 2009 Q4 included \$1.9 billion correction to CVA versus earnings of \$3.5 billion) ◆Active counterparty risk management ⇒ hedge counterparty risk to reduce P&L volatility and permit business with

specific names ◆Management of regulatory capital ⇒ reduce regulatory capital if c/p exposure hedged (Basel IIII double default formula)

CVA modeling issues

• Expected Positive Exposure (EPE) vs Potential Future Exposure (PFE), used for limit control purposes and measured to higher confidence level (95%, 97.5% or 99%); CVA for accounting adjustment ⇒ "mark to market plus add-on"; CVA actively traded ⇒ Monte Carlo methodology; Use real world (historical) simulation for PFE but risk neutral (market implied) of CVA ⇒ different models between PFE and CVA or calibrated differently → Default scenarios (simple) multiply EPE by static Probability of Default (PD) and Loss Given Default (LGD) (complex) correlate PD with market risk factors for simulation → CVA sensitivities IR, FX, Credit deltas, gammas and cross-gammas (2nd derivative; for option on S_1 and S_2, cross gamma) → Wrong way risk (risk for transaction exposure and counterparty default be positively correlated); counterparty risk increases if positive correlation (at time of default, MTM of counterparty's portfolio >> average value); wrong way risk difficult to model because requires correlations between default probability and transaction MTM → Unilateral or bilateral basis unilateral CVA accounts for bank's exposure to its counterparties; bilateral calculation includes counterparty's exposure on the bank

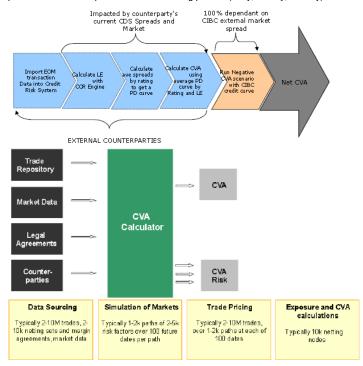

CVA Data requirements

•Market data •Name-specific credit spread curves — Spot Spread and 90-Day Average Spread •Average credit spread curves by rating — Spot Spread and 90-Day Average Spread •Reference Data •LGD by facility External (S&P) • Rating mapped to internal rating (with mapping rules) •Input Data Processing •Credit spread curves from market data +LGD ⇒ bootstrap PD (probability of default) using risk-neutral measures to calculate CVA. Use average spread curve if name-specific curve is missing for 1 counterparty •Overrides •PD overrides •LGD overrides •Name-specific credit spread curves overrides, e.g., +50bps for all or selected tenors •Average spread curves overrides, e.g., +50bps for all or selected tenors •Rating mapping overrides, e.g., re-map one name specific spread curve (Rogers A) to another average spread curve (Averaging BBB)

CVA Calculation Process

CVA dependent process

●Pre-deal Check ●What-if Analysis ●Intra-day Incremental (real time feeds) ●EOD Batch process ●Month-end process ●Stress Testing process (Daily, Weekly, Monthly)

Bi-lateral CVA and Net CVA-dependent process

•Intra-day Incremental for real time feeds •End-of-Day Batch process •Month-end process •Stress Testing process (Daily/Weekly/Monthly)

Negative/positive CVA

•If Bank A faces more credit risk than Counterparty B, CVA is **negative** (i.e. it reduces the value of the OTC derivatives from the perspective of Bank A) •If Bank A faces less credit risk than Counterparty B, CVA is **positive** (i.e. it increases the value of the derivatives from the perspective of A) •If present values of the credit risks are same, CVA = **zero**

CVA versus IRC

•CVA is for OTC credit risk measurement •IRC for capital charge calculation •CVA accounts for change in net exposure of A to B = E_AS_A - E_BS_B , where E_A =net exposure of B to A, S_A =mean loss rate of A (EL*PD)= credit risk of A or B potential loss if A defaults. CVA>0, A may risk losing •IRC incremental capital charge because VaR does not account for credit events (default and migration)

TRACS (Credit Risk)

• Multi-dimensional analytics system with capability to analyze syndication strategy by evaluating complex structured transactions, counterparty risk, industry group and client structure, limits and exposure **2TRACS** Feed System .NET Windows service responsible for processing (80+) incoming feeds & ensuring correct mapping into main TRACS database ● Auxiliary Deal Module (ADM) deal entry & manual adjustment tool (Transaction Override Module, Deal Level MTM and Security Price Override Module, Deal Structures Module, Manual Deal Entry Module) Availability Inquiry Module (AIM) to evaluate whether to approve or deny potential deals (①Deal approval / denial based on current risk exposure levels, daily settlement limits, counterparty term limits @Availability Profile reports for counterparties & deal types 3 Daily Settlement Limit exposure profile reports **@Counterparty Exposure Summary** reports **©Counterparty Deal Detail** reports © Exposure Graphing for counterparty)

Credit Report Automation (CRA) Credit Stress Engine (CSE) Calculate stressed LE & MTM of OTC Derivatives, Repo-style, and Credit Derivatives profiles based on PD, LGD, perturbed parameters @Credit Simulation Module (CSM) measures sensitivity of counterparty derivative portfolios to small market movements & large market shocks @Exposure Simulation Module (ESM) determines potential worst-case loss on counterparty's portfolio +ESM Batch application runs market simulations daily • 'What if' scenarios executed anytime • Calculated values • Average MTM •Loan Equivalent (or Average Positive MTM) •Credit Equivalent (or 97.5% MTM) 3 GL Reconciliation Analytical Tool delta analysis of risk measures across time series & aggregations through drill down of input parameters and deal data 9KMV computes credit risk of economic capital for large corporate loans & expected loan losses (using Moody's .NET application to modify counterparty characteristics (e.g., exposure limits, contact information) • Monthly Parameters Update to update historical data at month start • MTM Difference interface to examine differences in mark-to-market

Systems and Components

System	Component	Description
Voyager (24)	Limit Management and Maintenance	Set limits for risk measures (risk and sensitivities) stored in Voyager - on every business entity/risk measure combination and stores limit changes history
0	HMT - Hierarchy Maintenance	Create and change hierarchies of business entities and stores hierarchy change history
€	Manual adjustments to inputs	Create adjustments for position attributes and sensitivities and store adjustment history
4	Sensitivities (Greeks) Calculation (Euclid)	Calculate greeks from position data and market data (supplied by GA2)
6	HistSim	Calculate HistSim and DGVT VaR from sensitivities (greeks) inputs for all hierarchies and business entities. The calculation is for different types of risk, generally delta, gamma, vega and overall risk for Equities, Commodities, IR, FX instruments.
	DGVT VaR	
	Market VaR	
6	Static PL - Market SPL calculation back testing	Calculation of total and decomposed market PL (greek based)
0	Odyssey - Market Stress PL Calculation	Calculation of greek based stress PL
8	Odyssey Web - Market Stress Scenario maintenance	Create and maintain (update, delete) market stress scenarios by defining shocks to risk factors.

9	Stress VaR for Debt Specific Risk	Calculation of DS VaR with stressed input parameters	
0	VaRTool - Desktop	Calculation of DGVT and HistSim VaR for real or simulated (user	
	calculation	defined) portfolios	
		Functionality to use positional inputs and market inputs from different days	
		Uses Voyager to get the greek inputs	
0	VaRTool - Desktop	Calculation of DSR for real or simulated (user defined) portfolios	
	DSVaR tool	Use positional inputs and market parameters from different days	
0	RAROC calculator	Economic capital calculation in Voyager. Used from Chief	
		Accountant's Division	
6	Regulatory Capital	Storage of RAROC historically Calculation of regulatory capital associated with General Market	
	calculator	and Issuer-Specific Risk	
4	BCAR (Basel Capital	Risk Weighted Asset Data for monthly CAD reporting	
6	Adequacy Return) Stats	Engine calculated statistic parameters for the different market risk	
		factors by processing their return time series	
0	Enterprise DB Staging	Data Store with Raw data and results.	
Ø	and Enterprise DB MTS Gateway	Delivery mechanism to deliver data from multiple data sources	
	W10 Caleway	across different system environment.	
•	OMR Adjustment Tool	End user adjustment tool to adjust OMR Securities Month End	
	I	positions for RWA – OMR (Interest Rate - Asset Backed Security, Collateralized Mortgage Obligations, Mortgage Backed Security,	
		Interest Rate Swap, Loan & Deposits)	
9	Enterprise Easy Update Tool	Web end user interfaces to perform ad-hoc updates	
0	Voyager Easy Update	Web end user interfaces to perform ad-hoc updates	
0	Tool Gemini	Aggregate actual P&L data from DFE. Provides adjustment	
	Cerriirii	capabilities and calculates various statistical measures which are	
		then loaded into Voyager	
0	MBVaR	Merchant Banking VaR	
€	LTVaR	Long Term VaR	
4	Re-Insurance	Atlas	
TRACS	MTM and Other	AIM, MCM, ADM, ESM Console, PEF, FX Web link/dealing, CSE	
(13) ①	TRACS User Interfaces	Web App, CSM Web App, MTM Differences, Table Maintenance Tool (TMT)	
0	TRACS reporting	Reporting environment - databases (daily, weekly, monthly),	
		OLAP cubes and web plus all OLAP cubes (including TAT), web applications and automations (Credit Report Automation CRA)	
		- includes report usage logs	
€	PARAM Process	Monthly parameter calibration databases and all monthly parameter calibration processes	
4	Exposure Simulation I	Module ESM Engine + ESM Batch Processes	
6		CSE and all CSE Batch Processes	
6	Credit Simulation Module CSM Engine, CSM Databases and all CSM Batch Processes		
0	Month End Processing Month End databases and all month end batch processes for		
	and Databases month end regulatory - reporting and economic capital reporting		
	DEE - Monthly DEE date	including CVA calculations - abases and all monthly PEF processes

●Late feeds ●Interrupted file transfer ●Data integrity (uploaded data) ●Outage caused by change/ network

SUNGARD Contract terminology

"Active Deal" = Single trade record in the Adaptiv Credit Risk database where such record is subject to evaluation or aggregation processing for the purpose of credit exposure calculations as specified in the FRS. Such exposure calculations include but are not limited to: potential future exposure (PFE), settlement risk and issuer risk "Adaptiv Credit Risk" or "ACR" = Standard Software module (including any updates thereto) of the ASP Services providing global credit exposure data aggregation and management, credit limit management and related functions "AdaptivTrack" = SunGard Incident Management System "Band" = tier of Transaction volumes and associated Transaction Fees as set out in Section 3.5 to Part F of this Schedule 2 "Billable Dealing Transaction" = deal entry, deal modify or deal reversal activity recorded in ACR where such activity triggers a portfolio exposure update as part of the Transaction. For the avoidance of doubt, pre-deal checks, mark-to-market updates or any other end user activity are generally not considered Billable Dealing Transactions "Downtime" = time period in which the ASP Services were unavailable to process Transactions, as further defined in Section 5 of Part B of this Schedule 2 "End of Day" or "End Of Period" = overnight batch process sequence as further described in the documents referenced in Section 2.1 of Part A of this Schedule 2; "Initial Term" = time period commencing on the Schedule 2 Effective Date and ending on the earlier of: (a) the fifth anniversary date from the date of Adaptiv Credit Risk First Productive Use, plus the number of days between the date of Adaptiv Credit Risk First Productive Use and December 31st in the calendar year into which the date of Adaptiv Credit Risk First Productive Use falls; (b) the date this Schedule 2 is terminated by either

Party in accordance with the terms of this Schedule 2 and the Agreement Renewal Term" = each successive three (3) year period after the Initial Term for which this Schedule is renewed in accordance with clause 2.2 of the Agreement "Risk Carrier" = special type of Active Deal that stores the exposure profile for a portfolio, representing a system generated container within Adaptiv Credit Risk for an externally generated exposure profile "Risk Carrier Transaction" = special type of dealing Transaction impacting a Risk Carrier deal in the ACR database that stores the exposure profiles for a portfolio of other deal contracts, such Transactions being of the add, modify or reverse types "Standard Software" = any Release of: Adaptiv Credit Risk Server; including inter alia Web UI (the "Portal"); Core processing server; Real-time interface handler; and Batch interface handler "UK Business Hours" = time period between 09:00 a.m. and 17:00 p.m. (UK local time) on any day from Monday to Friday, excluding official UK bank holidays.

SUNGARD Modules

Adaptiv Component	Functional Description	Risk Type
Master Data Store (MDS)	Central repository for all trades, issue and static data. The trades types represented in the MDS correspond with products in the various client Front Office systems. Each modification to the data set is validated and audited.	Market Credit
Risk Hub	This is the main application component, hosting the portfolio membership rules, aggregation logic and mapping of the MDS trade format to AA trade format. The following functions are available: Data Admin Tool: Input and maintenance of static data Customer mapping Input of deal corrections and exposure overrides Viewing and acting on exceptions and warnings Limits and Workflow: Setting of term-based exposure limits Setting of maturity checks Setting of authorised products Processing of Excesses and Violations Exposure Monitoring: Viewing of exposures by portfolio Pre-deal checks What-If analysis Canned Reports: Paper-based reporting	Market Credit
RiskScape	Historical exposure database: - Max deal measure values per business day - 15-point portfolio profiles per business day (Note: Full granularity of profile is available in binary format for interrogation where required. This will be built into specified reports (see for example Credit As-Of in Ref #3), and can be inspected ad-hoc via a SunGard tool	Credit

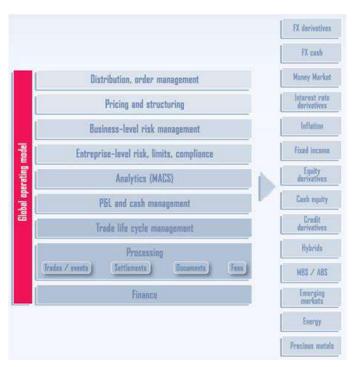

Adaptiv Component	Functional Description	Risk Type	
StressScape	 Max deal measure values per stress test ID 15-point portfolio profiles per stress test ID (NOTE: Full granularity of profile is available in binary format for interrogation where required. This will be built into specified reports (see for example Credit As-Of in Ref #3), and can be inspected ad-hoc via a SunGard tool 		
MDS Interface Layer	This handles all interactions between MDS and CIBC upstream and downstream systems. Functions are: - Validation of files received - Conversion of files to "delta" operations - Collection and processing of exceptions	Market Credit	
Adaptiv Analytics (AA)	Monte-Carlo (MC) valuation of applicable trades for market and credit risk based on data with each request. There will be two model sets: SunGard AA models value trades in FO systems other than X-Trader - RAF models (built by CIBC) value trades booked in X-Trader *AA performs for Credit Risk aggregations of applicable trades to be passed back to ARH for further aggregation with Factor-based trades. *Incremental Monte-Carlo (IMC) used for real-time exposures MR + CR *Analytics for market risk produces scenario results for: VaR - P&L stress tests - Scenario PV values for Historical Simulation by factor group Scenario PV values for MC market VaR by factor group No-action P&L IRC - (DSR) IR and EQ specific risk scenario PV values *Trade associations to Risk Factors Analytics Workspace providing users with ability to what-if or replay analyses.	Market Credit	
Market Data Manager (MDM)	This is the central repository for all market data, including data for pricing parameters, current market rates, and historical time series. Functions are: - Volatify correlation statistic sets and MC drivers - Current rates and pricing parameters - Calibration of the data based on the models MDM will be fed data from upstream; read-only access for users.	Market Credit	
Valuation Input Store (VIS)	This component stores the history of AA formatted trade data, market/historical data, and calculation parameters passed to AA that were used to calculate the scenario PVs. It acts as the principal source for audit, corrections and reproducibility of scenario PVs collected by the RiskCube. The VIS provides the ability to retrieve the trade/market data for any as-of date, and supports corrections to this data. The VIS supports workflow events that control the process for EoD, trade corrections, market data corrections, and late feed processing.	Market	
Adaptiv Risk Cube (ARC)	This component allows the viewing, calculation and storage of market risk results dynamically aggregated to users' requested dimension and drilldown to the trade level. ARC receives scenario PV data from AA calculations, and provides drill down slice & dice analysis functionality based on a set of attributes tagged against each trade. These trade tags define the dimensions of the drill down filters.	Market	
SWORD	Monitoring of: - KRIs - Adaptiv workflows	Operational Risk	

MUREX

Murex FX Deals

Spot Trade settlement/delivery takes place within 1 to 2 business days Outright/Forward settlement/delivery takes place on any date other than spot Swap (+Overnight) consisting of two parts (Near Leg + Far Leg) Take Ups (Time Options) Forward valued trade where the counterparty has the right to trigger delivery of funds between specified date & value date OIS Overnight Index Swap overnight rate exchanged for some fixed interest rate IRS Interest Rate Swap one party exchanging a stream of interest for another's party's stream DEPO Deposit counterparty agrees to take on funds at a specified rate LOAN counterparty aggress to sell funds at a specified rate Futures Trade allows trader to buy or sell specified amount of given currency at specified price on specific date in future

	alisation in each asset class inctionality in each asset class. Native coverage includes several hundreds et classes.
Equities:	Cash and basket trading, index and equity futures and options, exotic options, all kinds of convertibles and warrants, equity swaps and CFDs, equity-linked notes and structured deals.
Interest rates:	money markets, treasury bonds and repos, interest rate derivatives including exotics, emerging markets and structured deals.
Foreign Exchange:	Spot and forward, vanilla and exotic options.
Credit:	Bonds, convertibles, loans, vanilla credit derivatives (CDS, credit options, baskets, etc.) and structured credit (e.g. structured CDOs).
Macroeconomic derivatives;	Mainly inflation bonds, swaps and options
Energy & Commodities:	Electricity, crude oil and refined products, coal, natural gas, emissions, base metals, pulp, precious metals, soft commodities / agris, freight derivatives (dry & wet), Both physical and financial trades are supported.
Hybrids:	transactions combining any asset class.

FX portfolios

All Spot portfolios will be owned and maintained within their own region. As well, all non-CAD forwards trades will be maintained in their respective portfolios. All CAD forwards will be routed to the Toronto Forward book 'Darrin Brooker' from all regions. The FX system will strip out all forward CAD positions of booked trades to portfolio 'Darrin Brooker', regardless of the geographical origin of that trade. Any non-CAD forward positions will remain in the respective trading center. All portfolios will have the capability to input trades in all MurexFX supported products and view their risk on a portfolio basis.

MUREX trade flow

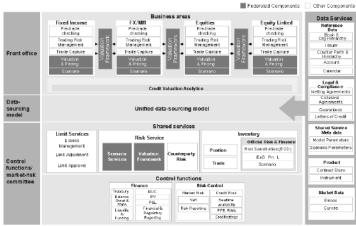

Trading system interfaces

Electronic Broking Systems EBS's closest competitor is Reuters Dealing 3000 Spot Matching. The decision by an FX trader whether to use EBS or Thomson Reuters Matching is driven largely by currency pair. In practice, EBS is the primary trading venue for EUR/USD, USD/JPY, EUR/JPY, USD/CHF and EUR/CHF, and Thomson Reuters Matching is the primary trading venue for commonwealth (AUD/USD, NZD/USD, USD/CAD) and emerging market currency pairs.

P&L Calculation

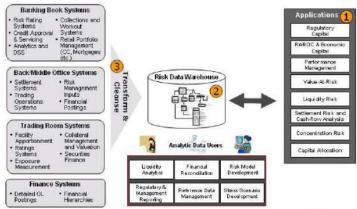

Deal's 4 components ●Exchange Rate ●Base Rate ●Spread & Discounts ●Amounts Consider EUR/JPY trade for \$1M buying EUR, exchange= 161.5257 (-0.015 discount), base rate= 1.358677 EUR/USD (0.000056 discount), spread of 0.002 (on the EUR rate) JPY amounts = \$1M * 161.527 (Exch. Rate) = 161,527,000.00; USD/JPY forward rate = 118.8505504 (Exch. Rate / Base Rate) + spot rate = 118.87050406 (Exch. Rate + Exch. Discount); EUR/USD forward rate = 1.360677 (Base Rate + Spread) + spot rate = 1.360621 (Base Rate + Spread - Base Discount) ⇒ spread P&L generated on this trade 2000 EUR (EUR/USD Forward Rate * 1M - (Base Rate * 1M)) ⇒ 1472.02 USD IN P&L

Risk IT Architecture

<u>Federated Architecture (FA)</u> = pattern in enterprise architecture that allows interoperability and information sharing between semi-autonomous de-centrally organized lines of business (LOBs), information technology systems and applications

On Risk Data architecture

●Data Processing applications extract-and-process ●Analytic Repository simple reporting to complex ad-hoc queries, usually a confusing mish-mash of different systems ● Data Cleansing and Transformation from flat files, real-time data from data bus, data quality issues, snapshot data vs. changes - large volumes with imperfections in data

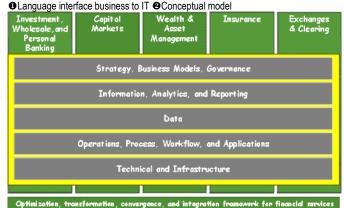

Risk Data Management

On Financial Risk Data Requirements

●Detail rather than aggregate data but detailed transactional and position data for onrequest/ situational ad-hoc aggregates ②Complete 100% coverage of all positions of the firm instead of only notional size of a position ③Timely analysis to keep up with rapidly moving markets ④Integrity correct data

Risk Data Management Best Practices

Capital reform, Liquidity Standards, Systemic Risk

Capital under BASEL III

Minimum Capital Standard

Regulatory Objectives

- 1-Increased quality of capital
- 2-Increased quantity of capital

s airned at improving the quality of oxpital, with the ultimate aim to improve loss-absorptic I liquidation significant.

Description of the key changes

- Common equity and retained earnings should be the predominant component of Tier 1 capital instead of debt-like instruments, well above the current 50 percentrule.
- Harmonized and simplified requirements for Tier 2 capital with explicit target for Tier 2 capital.
- Full deduction for capital components with little loss absorption capacity such as minority interests, holdings in other financial institutions, DeferredTaxAssets.
- Gradual phase-out of hybrid Tier 1 components, including many of the step-up/innovative/SPV-issuedTier 1 instruments used by banks over the past decade.
- Implications
- BCBS measures are already discounted by markets, so banks are likely to clean up their balance sheets as soon as possible.
- Likely to see raising of significant capital by banks, along with
- National regulators will have less the oblity to allow capital instruments to be included in Fig. 1 or Fig. 2 capital.

retention of profits and reduced dividends

Systemically important banks (and, potentially, all banks) may be allowed to issue contingent convertibles to meet additional capital requirements.

Description of the key changes

Minimum common equity Tier 1:

- Increased from 2.0 percent to 4.5 percent
- Plus capital conservation buffer of 2.5 percent.
- Bringing total common equity requirements to 7.0 percent
- To be phased in from 2013 to 2019.

Minimum total capital:

- Increased from 8.0 percent to 10.5 percent |including conservation buffer)
- To be phased in from 2013 to 2019.

Counter-cyclical capital buffer is being developed, which is expected to be implemented by increases to the capital conservation buffer during periods of excessive credit growth.

- Banks will face a significant additional capital requirement, and the bulk of this shortfall will need to be raised as common equity or otherwise by retaining dividends
- In principle, banks will be able to draw on the capital conservation buffer during periods of stress, but it seems unlikely that they would choose to do so, given the associated constraints on their earnings distributions.
- Consequently, banks are likely to target a higher common equity ratio and the market expectation for common equity. Tier 1 appears to be moving to approximately 9 percent
- . There is likely to be further add-ons for Pillar 2 risks, systemically important firms, and the counter-cyclical capital buffer, so banks may target a total capital ratio of 13–15 percent

3-Reduced leverage with backstop leverage ratio

4-Increased short-term liquidity coverage

Description of the key changes

- The leverage limit is set as 3 percent, i.e. a bank's total assets (including both on- and off-balance-sheet assets) should not be more than 33 times bank capital.
- In 2011, reporting templates will be developed. In 2013, regulators will start monitoring leverage ratio clata, and the ratio will be effective from January 2018.
- The ratio is introduced to supplement the risk-based measures of regulatory capital
- The leverage ratio is implemented on a gross and unweighted basis, not taking into account the risks related to the assets.

Implications

- The introduction of the leverage ratio could lead to reduced capital position, although it remains to be seen whether the ratio will bite for individual firms.
- The non-risk-adjusted measure could incentivize banks to focus on higher-risk/higher-return lending.
- Pressure arises on banks to sall low margin assets (e.g., mortgages), which could drive down prices on these assets
- agencies to maintain a higher leverage ratio that the regulator. Banks may be required by the market and the rating

Description of the key changes

- The 30-day Liquidity Coverage Flatio (LCR) is intended to promote short-term resilience to potential liquidity disruptions. The LCR will help ensure that global banks have sufficient high-quality liquid assets to withstand a stressed funding scenario specified by supervisors.
- For the LCR, the stock of high-quality liquid assets is compared with expected cash outflows over a 30-day stress scenario. The expected cash outflows are to be covered by sufficiently liquid, high-quality assets.
- Assets get a 1 iquidity based weighting varying from 100 percent for government bands and cash to weightings of 0 percent – 50 percent for corporate bands.

- The Risk of impact from a bankrun should be reduced, which would improve the overall stability of the financial se
- The introduction of the LCR will require banks to hold significantly more liquid, low-yielding assets to meet the LCR, which will have a negative impact on profitability.
- Banks will change their funding profile, which will lead to more demand for longer-term funding. This funding may not be available from institutional investors that generally seek to reduce their holdings in the financial sector.
- Interpretation of 'right' run-off rates by national regulators may cause level-playing field discussions.

5-Increased stable long-term balance sheet funding

6-Strengthen risk capture notably counterparty risk

agulatory objective – (SI Increased stable long termbalance sheet funding ne Net Stable Funding Ratio INSER) is designed to encourage and incentivize banks to use stable sources to fund their ctivities to reduce the dependency on short-torm witholeside funding.

Description of the key changes

- The NSFR compares available funding sources with funding needs resulting from the assets on the B/S.
- Available stable funding > required stable funding.
- Required and available funding amounts are determined using weighing factors, reflecting the "stability" of the funding available and the duration of the asset
- The weighing factors for assets vary from 0 percent and 5 percent for cash and government bonds, respectively to, 65 percent for mortgages, 85 percent for retail loans, and 100 percent for other assets.
- For determining stable funding available for liabilities, the weighing factors vary from 100 percent for Tier 1 capital to 50 percent for occe retail deposits and 50 percent for unsecured wholesale funding. ECB funding is weighed at 0 percent

Implications

- The NSFR incentivizes banks to reduce their reliance on short-term wholesale funding and increase stability of the funding mb.
- Banks will need to increase the proportion of wholesale and corporate deposits with maturities greater than one year, but currently, the appetite for term debt is limited.
- For most banks, it will be difficult to increase the proportion of wholesale deposits with maturities greater than one year (limited market demand), which is likely to lead to higher funding costs.
- Managing the NSFR by altering the asset mix will likely result in an increase in the proportion of short-term assets, reducing
- Stronger banks with a higher NSFR will be able to influence market pricing of assets. Weaker banks will see their competitiveness reduced, which will potentially decrease the level of competition.

Regulatory objective – (6) Strengthed risk capture, notably counterparty risk

The BCSB seeks to ensure I closers go of fisks in Spritter Plant 1 framework, increasing the capital requirements against tisk as adequately expressed in the Seeks I spritter in the Seeks I spritter

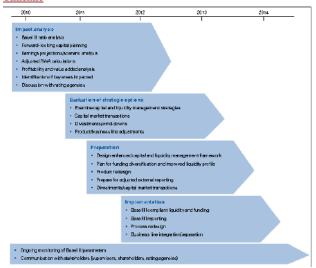

Description of the key changes

- Calibration of counterparty credit risk modelling approaches such as Internal Model Methods (IMM) to stressed periods
- Increased correlation for certain financial institutions in the IRB formula to reflect experience of the recent crisis, new capital charges for Credit Valuetion Adjustments, and wrong-way risk
- "Carrot and stick" approach to encouraging use of central counterparties (CCPs) for standardized derivatives
- Improved counterparty risk management standards in the areas of collateral management and stress-testing

Lecelies tiers

- Still a degree of uncertainty over the find capital impact as CreditValuation Adjustments charge is being revised to reflect significant inclustry criticism.
- Controls and quality of the CCPs' risk management is critical as risk is focused on central bodies.
- Reduce level of intra-financial sector business arising from incressed capital charges intra-sector.
- Costs of dealing with financial counterparties need to be priced into the business, leading to a review of the business model

Timeline

Enterprise Risk

ERM framework

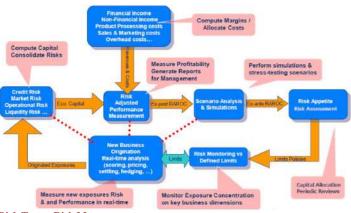

- Strategic Risk Management enabled by strong governance, identification, assessment, management of risks
- **Key tools** include risk appetite, risk assessments, stress testing, capital management
- Analysis uses multiple approaches & lenses (accounting and economic) to assess risk and reward

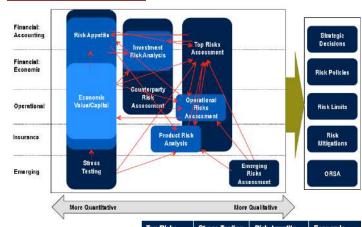

Risk Appetite, Assessment, Measurement

RISK APPETITE	RISK ASSESSMENT	RISK MEASUREMENT

		Tra	de Counterpartie	es	Non-client counterpary misperformance Mise. non-client counterparty disputes
		Ver	ndors and Suppli	ers (Outsourcing vendor disputes

Assessment Approach

1 Input to Risk Catalogue

The required inputs to the risk catalogue must be able to adequately assess both the frequency of failure occurrences and severity of loss in order to obtain a measure of net operation risk.

Frequency of occurrences can be assessed using internal reports as well as external reports. These reports include:

- Audit reports
- Regulatory reports
- Management reports
- Expense reports
- Deviation from business plans
- Operational plans

Severity loss can be assessed from:

- Management interviews, both pre and post mortem
- Variance on budgets
- Insurance claims
- Loss history

2 Risk Assessment Scorecard

A risk assessment scorecard is used to assess each business or operational unit with the help of risk catalogue and inputs from step 1. Risk assessment scorecard will identify and assess the nature of operational risk based on the following broad points:

- Risk categories such as people, process, technology and external dependencies
- Connectivity and interdependencies among the risk categories.
- Change in work environment
- Complexity of products, processes or technology
- > Complacency factor due to ineffective management of the unit
- Frequency and severity assessments
- Net operational risk, evaluated net of risk mitigants

The final result is the net risk assessment.

3 Review and Validation

Once the risk assessment is completed, operational risk management committee must review the assessment results with the management of the respective business unit and other key officers of the institution. Some of the responsibilities of the committee include:

- The committee must formulate a set of operational risk policies and guidelines, which clearly determine the actions needed to correct and prevent the operational problems and issues.
- It should determine the important difference between the unit's own self-assessment and the independent assessment.
- It should express opinion on the risk rating in the risk scorecards before publication.
- It should issue mandatory report and list of recommendations to the affected business units in conjunction with audit and compliance departments.

Output of assessment process

Operational risk assessment process can have several outputs. These outputs can be broadly categorized into three items. They are:

1. Improved risk reporting and analysis:

One of the important outputs of operational risk assessment process is the risk report. These reports provide relative information on operational risk exposures across the institution. Some of the important reporting tools are: risk catalogue, risk scorecard and heat map.

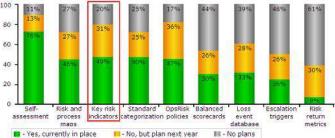

2. OCC exam chart

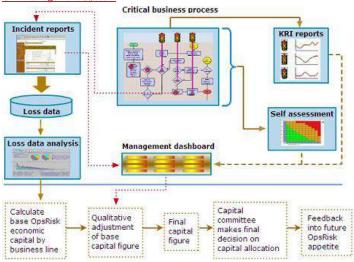

Outputs of risk assessment process such as risk scorecard and other reports helps to graphically represent the evaluation of business unit in a concise manner in line with the OCC examination procedure.

3. Capital attribution

Risk assessment report assist in attributing economic capital to operational risk. Business units, which are more prone to operational failures, are assigned a greater allocation of capital commensurate to the risks that they take.

System capabilities for OTC derivatives central trading and clearing

●Support enterprise data management for a 360° view of risk/ performance ❷Automate position valuation & generation of variation margin SAutomatically reconcile discrepancies against transacting counterparty @Support full straight-through-processing (STP) workflow for OTC swaps SProvide transparency in trade transaction flow for full disclosure **⑥** Communicate real-time details of trades and collateral to all relevant parties **⑥** Provide broad instrument coverage that includes centrally & bilaterally cleared trades plus instruments outside of Dodd-Frank Support real-time reporting to reflect the most up-todate view of positions and trades

Straight Through Processing STP

Characteristics of an STP solution:

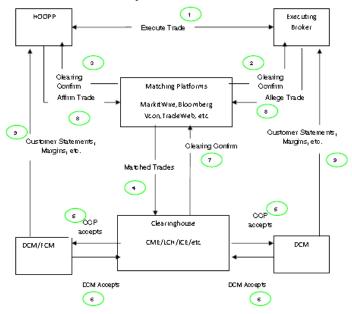

- Automated
- Removal of paper No manual re-keving
- Control of workflow
- End-to-end
 - Transaction initiation, repair, tracking, management, reporting
- Integrated
- Front to back
- In house with market infrastructure
- External service providers
- Managed by exception
 - Alerts
 - Repair facilities
 - STP rates & statistics

HOOPP Process for transacting & clearing a trade

- HOOPP and Dealer agree to trade through electronic trading platform
- Dealer Allegestrade on Matching Platform HOOPP affirms trade, selects it for clearing and designates a Derivative Clearing Member (DCM)
- Member (pc.m) Matched/Affirmed trade is sent to Clearinghouse Clearinghouse checks overall DCM limits and id ok sends confirm to DCMs
- DCMs checks clients limits and accepts trade at Clearinghouse Clearinghouse generates clearing confirm to Matching platform
- Macthing platform sends clearing message to trading parties DCMs send statement, margin calls, etc. to HOOPP

Corporate Accounting System (CAS)

Corporate Accounting System (CAS)

Corporate Accounting Services provide benefits from economies of scale to enhanced security, accuracy, availability and reliability of government's financial data for customer and corporate decision making. A mandate from the Office of the Comptroller General (OCG) is in place requiring all government entities that are part of the Consolidated Revenue Fund (CRF) to share a single set of books and to process their financial transactions through the government-wide financial system. This consolidated approach eliminates the need for duplicate or partial "shadow" financial systems across government. All financial information is consolidated into one system for making payments; issuing invoices and T4As; auditing and reporting; and, publication of the Public Accounts (i.e., the 'Blue Book'). The OCG relies on the system as the "one source of truth" for government financial data. No other organization within Government provides similar products or services to those offered by Corporate Accounting Services.

The Oracle Financials eBusiness suite of applications and databases, described briefly below, comprises the corporate enterprise financial system that allows the BC Government to process and record all financial transactions.

CAS - General ledger: The General Ledger module (GL) is a complete financial management system for provincial government ministries and agencies. Budget information is loaded into CAS Oracle Financials as is the Chart of Accounts. The GL module is updated from all sub-systems (Accounts Payable, Accounts Receivable, Purchasing, and Fixed Assets), as well as from CAS Generic Interface (CGI). The GL is updated instantly on-line for all manually entered and posted journals. The GL module is composed of several functions that users access to enter and correct journals, run reports and inquire on data entered either directly or through one of the sub-systems and interfaces.

CAS - Accounts payable: The Accounts Payable (AP) module is used primarily to enter and adjust invoices. The Accounts Payable module is also used to run reports and to review invoices, invoice batches, payments, and the accounting and encumbrance entries for individual invoices and payments.

A payment process is run each business day to generate payments of all types. The accounting entries are then transferred and posted to the General Ledger.

CAS – Budget: The Budget Module provides a common system for BC government and non-BC government staff to build and maintain their budgets. Both the estimates (e.g., 'Blue Book') and working budgets maintained in the Budget Module may be posted to CAS Oracle General Ledger. The Budget Module allows one to maintain multi-year budgets.

CAS - Chart of accounts: The Chart of Accounts (COA) Module provides a common system for BC government and non-BC government staff to build and maintain their chart of accounts and post them to the CAS Oracle General Ledger. The Chart of Accounts also provides the ability to develop and maintain Rollup Hierarchies used to report on budgets in the Budget Module.

CAS - Contract management: Contract Management is an extension to the government's corporate accounting system. It integrates the creation and administration of contracts with the government's financial systems.

CAS — Fixed assets: The Fixed Assets module (FA) is a complete assets management tool used to enter and maintain capital and attractive assets information including Construction In Process (CIP) assets. Asset maintenance includes the transfer, retirement and disposal of assets, as well as depreciation, calculation of gains and losses, and capitalization functionality. The Fixed Assets module allows the definition of depreciation methods and cellings, as well as the creation of journals to be posted directly to the General Ledger.

CAS - Expenses reporting (iExpenses): iExpenses is a web-based application used by employees to enter and submit expense reports for reimbursement of business travel expenses. Through IExpenses, employees can check the status of their expense reports, view payment information, and access their notifications; approved Expense Reports are imported to accounts payable. iExpenses is an Oracle product.

CAS - Purchase requisitions (iProcurement): iProcurement is a web-based application used to enter requisitions to initiate the purchase of goods and services sourced through Corporate Supply Arrangements (CSAs), BC Bid, or by Ministries. Expense Authorities approve these requisitions through workflow notifications. Approving requisitions updates the General Ledger.

Requisitions are auto created onto on-line Purchase Orders (POs) in the Purchasing module, drawing down the commitment encumbrance and increasing the obligation encumbrance balance in the General Ledger. PDF documents are generated for communication with the supplier.

Procurement is also used to acknowledge receipt of goods and services before invoices are matched to POs in the Accounts Payable module. iProcurement is an Oracle product.

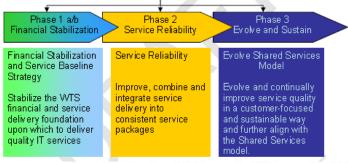

CAS – Data Warehouse Reporting and Analytic Tools: The CAS Data Warehouse (DW) has been designed for ministry reporting. The Data Warehouse tables are refreshed on a nightly basis and are current as of the close of the previous business day in CAS Oracle Financials. They contain data from the BC Government's Oracle Financials implementation of the "single set of books" as well as data for entities that do not fit into protocols defined for inclusion in the government set of books.

Currently the following reporting functionality is available either directly through the financial application or through the data warehouse. Express Financial Reports (EFR) are defined reports with a fixed set of parameters, intended to produce a basic report frequently generated. Standard Financial Reports (SFR) are similar to EFRs but they contain additional parameter selections, which allow for limited sorting capability and display options. These reports are intended to produce a slightly more detailed report than the EFRs. Web Form Reports (WFR) are a dynamic suite of reports that can be created and displayed in a variety of ways based on customers' selections. Workbooks are a collection of worksheets and, optionally, graphs that contain data from a particular business area that is organized to show different perspectives. In order to facilitate faster processing times for inquiry and reporting functions, data in the data warehouse is grouped into subject areas like AP, PO, AR, etc. Customers can also download data extracts.

Enhancements to real time financial reporting and business analytic reporting are growth areas for Corporate Accounting Services. In 2005, CAS developed a reporting and information strategy and has been systematically assessing and testing available tool sets that will provide role based dashboards and drilldown capabilities for executive decision making. A business intelligence tool has been piloted at CAS.

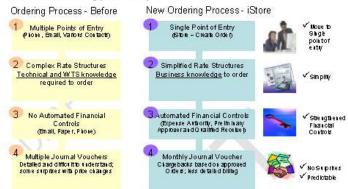

Business Transformation Initiative (BTI)

BUSINESS TRANSFORMATION - INCREMENTAL IMPROVEMENT APPROACH

	Phase 1a (Sept '06)	Phase 1b (07/08)	Ph 2 (08/09)	Ph 3 (09/10
Services 🍒	Simplify descriptions Understand costs	Improve descriptions Initial on-line ordering	Automated ordering solution Integrate with SSBC where makes sense	Consolidated catalogue
Ministry Partner- ships	Develop SDAs	Joint Planning Improve forecasting	Partners in planning Improve time to market Client Profile	•Integrated Ministry Agreements
Billing	Manual JV	Manual/Automated billing Improve financial controls	Corporate cost mgmt, and consumption tolerance.	
Mgmt. Reporting	Interim reporting tool for budgeting	New financial reporting in CAS DW	High data integrity Management information	Consolidated view of SSBC
Service Delivery		WTS Internal integration Propose service standards	Service Level Mgmt. Better change and incident management Integrated services where it makes sense	•Continue to integrate

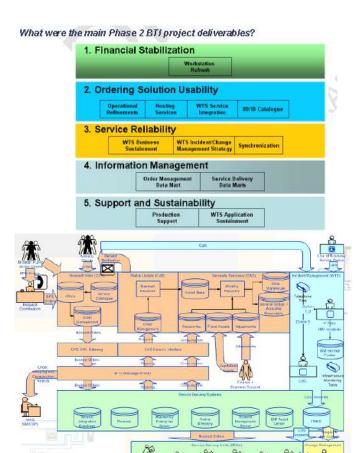

How was the ordering process improved?

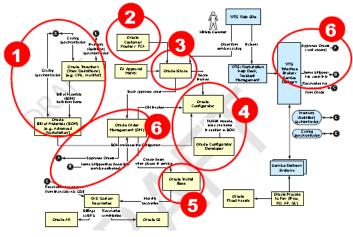

What is the high-level iStore ordering process?

iStore orders follow an approval/receipt process with the order status changes recorded and communicated at key intervals, ending with financial recovery (billing). The basic process is outlined below.

What are the key components that facilitate iStore financial transactions?

CIBC Mellon

History

CIBC Mellon was founded in 1996 after CIBC joined with Mellon Financial Corporation in a 50-50 joint venture named CIBC Mellon **Global Securities Services (CMGSS)**. The following year, 1997, CIBC purchased a 50% stake in The R-M Trust Company from Mellon, which would become CMGSS's sister company, **CIBC Mellon Trust Company (CMTC)**. CIBC Mellon acquired the Pension and Institutional Trust businesses from Canada Trust in 1997 and the global custody business from the Bank of Montreal in 1999. In 2002 CIBC Mellon acquired TD 3rd party investment fund custody business.

Scope

- Benchmark Metrics from implementation of Mellon European Financial System (EFS)
 - In 2005, Mellon U.S. spent \$8.5 Million USD on the EFS Project Implemented Oracle eBusiness Suite for financial management
 - Modules installed:
 - General Ledger

 - PurchasingAccounts Payable
 - Fixed Assets
 - Notes:
 - Project costs were revised upwards three times
 - The Mellon Key was devised for use across the Mellon enterprise. Mellon U.S. is available for ongoing consultation with CIBC Mellon
 - Mellon U.S. would consider running the application as a service provider for CIBC Mellon, if the Oracle eBusiness Suite were selected here
